

a small posterior or medial bristle. Each femur has a still smaller yellow bristle laterally near the apex. Claws slender, black, with the base reddish. Pulvilli slender, long and whitish. *Wings*: The wings are nearly hyaline, the second vein and the basal part of the third vein pale brown, other veins light brown. Marginal cell open narrowly. *Abdomen*: The abdomen is more robust than in *Laphystia annulata*, new species. Tergites dark, shining, brownish red with the whole lateral margins only pale brownish yellow pollinose. This pollen extends narrowly along the posterior margin of the sixth tergite but leaves the middle interrupted and bare. The short seventh and eighth tergites entirely pollinose. Pile over the middles of the tergites minute, flat appressed and reddish yellow. Side margins of first segment with 4 stout, reddish bristles and the second and third segments with 4, the fourth segment with 3 and the fifth and sixth segments each with 2 similarly colored bristles.

Type. Female; near Navajo, Arizona, July 11, 1954. Paratype female, same data. F. M. Hull collector. In the collection of the author.
